# Chapter 3 outline

- 3.1 transport-layer services
- 3.2 multiplexing and demultiplexing
- 3.3 connectionless transport: UDP
- 3.4 principles of reliable data transfer

- 3.5 connection-oriented transport: TCP
  - segment structure
  - reliable data transfer
  - flow control
  - connection management
- 3.6 principles of congestion control
- 3.7 TCP congestion control

## TCP flow control

application may remove data from TCP socket buffers ....

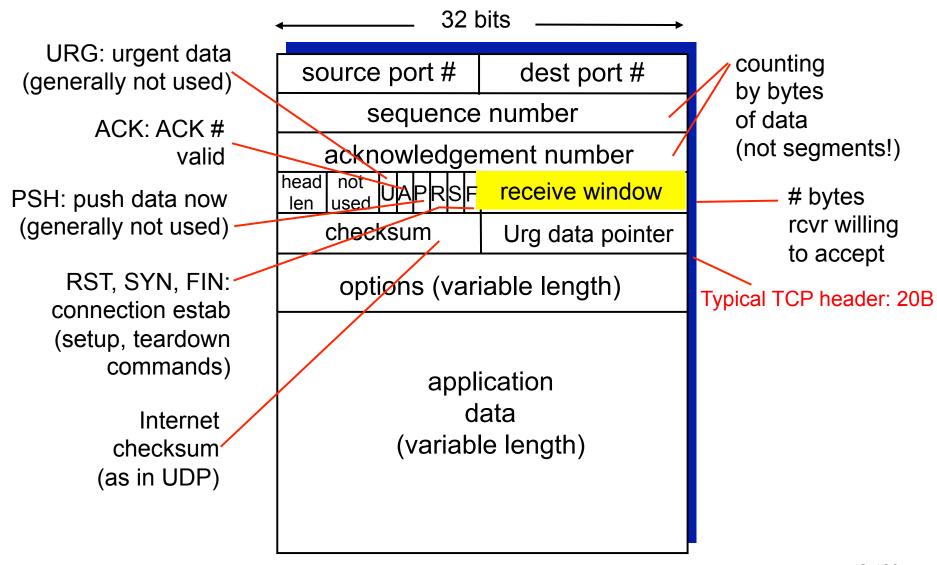

... slower than TCP receiver is delivering (sender is sending)

### application process application OS TCP socket receiver buffers **TCP** code ΙP code from sender

receiver protocol stack

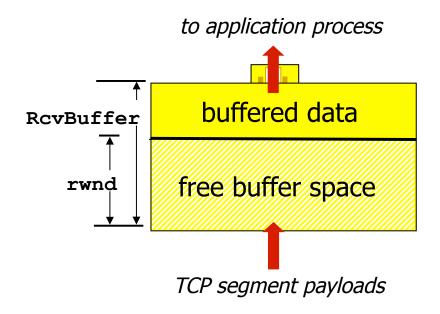

flow control receiver controls sender, so sender won't overflow receiver's buffer by transmitting too much, too fast

## TCP segment structure

### TCP flow control

- receiver "advertises" free buffer space by including rwnd value in TCP header of receiver-to-sender segments
  - RcvBuffer size set via socket options (typical default is 4096 bytes)
  - many operating systems autoadjust RcvBuffer
- sender limits amount of unacked ("in-flight") data to receiver's rwnd value
- guarantees receive buffer will not overflow
- See applet (Ch.3, Flow Control) companion website

receiver-side buffering
